Open your default browser and login to your google account.

In the same browser, open the following link.
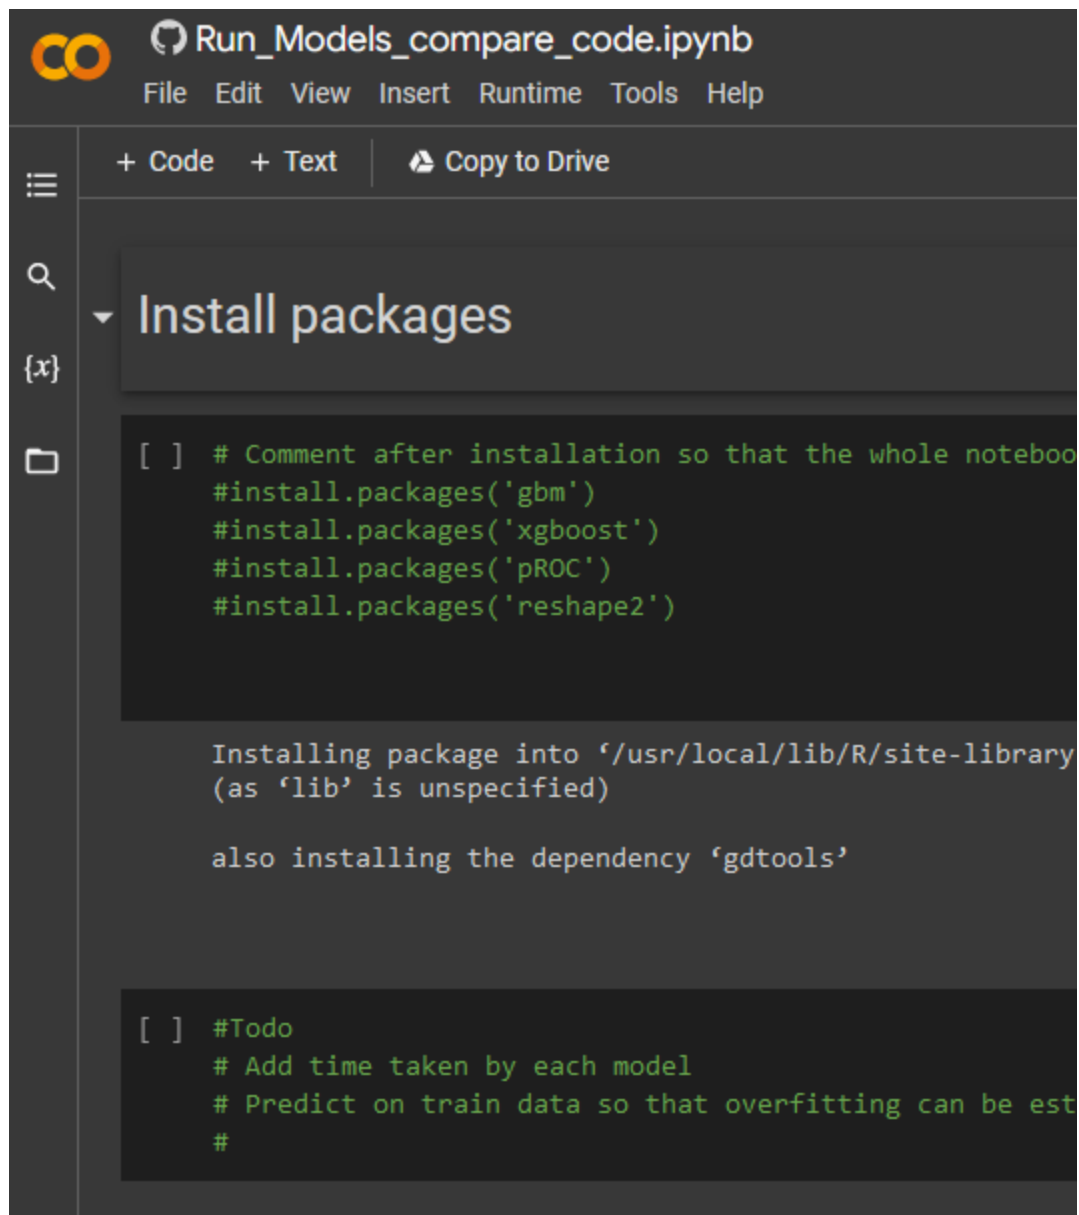

https://github.com/aparnasree2020/sampledata_casws/blob/main/Run_Models_compare_code.ipynb
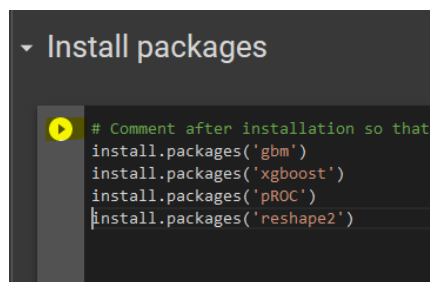

The screen should look like this.

Click on "Open in Colab" (marked in yellow)

This opens the colab google session which is were we will be running the R notebook.

If you are running the notebook for the first time, uncomment the install packages command and run the cell by clicking on the play button.

If your browser session closes, you will have to repeat this process again since the memory in colab is active only for that session.

Once you install the packages, you can comment the install packages commands.

Then you can run all the commands and you should be able to play around with the Notebook.
